INTRODUCTION

This application generates 2D nice random attractors pictures.

A Random Attractor “curve” is generated as follow:

There is a Random Start point $x(0), y(0)$.

There is a given Number of Points (also called iterations)

There is a set of Random Parameters $V(0), V(1), V(2), \dots V(N)$

Each Point Position $X(I), Y(I)$ is calculated with a formula that is like this:

$$X(I) = V(0) + V(1) * X(I-1) + V(2) * Y(I-1)$$

$$Y(I) = V(3) + V(4) * X(I-1) + V(5) * Y(I-1)$$

Commands

ATTRACTOR

Here we can choose the Attractor Formula.

Where XX, YY are $PtX(i-1), PtY(i-1)$

Paul Brouke

$$PtX(i) = V(0) + V(1) * XX + V(2) * XX * XX + V(3) * XX * YY + V(4) * YY + V(5) * YY * YY$$

$$PtY(i) = V(6) + V(7) * XX + V(8) * XX * XX + V(9) * XX * YY + V(10) * YY + V(11) * YY * YY$$

Clifford

$$PtX(i) = \sin(V(0) * YY) + V(2) * \cos(V(0) * XX)$$

$$PtY(i) = \sin(V(1) * XX) + V(3) * \cos(V(1) * YY)$$

De Jong

$$PtX(i) = \sin(V(0) * YY) - \cos(V(1) * XX)$$

$$PtY(i) = \sin(V(2) * XX) - \cos(V(3) * YY)$$

De Jong variation : Johnny Svensson

$$PtX(i) = V(3) * \sin(V(0) * XX) - \sin(V(1) * YY)$$

$$PtY(i) = V(2) * \cos(V(0) * XX) + \cos(V(1) * YY)$$

Sprott

$$PtX(i) = V(0) + XX * (V(1) + V(2) * XX + V(3) * YY) + YY * (V(4) + V(5) * YY)$$

$$PtY(i) = V(6) + XX * (V(7) + V(8) * XX + V(9) * YY) + YY * (V(10) + V(11) * YY)$$

Philp Ham

$$PtX(i) = \tan(XX) * \tan(XX) - \sin(YY) * \sin(YY) + V(0)$$

$$PtY(i) = (V(3) + 3) * \tan(XX) * \sin(YY) + V(1)$$

ABS

$$PtX(i) = V(0) + V(1) * XX + V(2) * YY + V(3) * \text{Abs}(XX) + V(4) * \text{Abs}(YY)$$

$$PtY(i) = V(5) + V(6) * XX + V(7) * YY + V(8) * \text{Abs}(XX) + V(9) * \text{Abs}(YY)$$

POW

$$PtX(i) = V(0) + V(1) * XX + V(2) * YY + V(3) * \text{Abs}(XX) + V(4) * \text{Abs}(YY) ^ (V(10))$$

$$PtY(i) = V(5) + V(6) * XX + V(7) * YY + V(8) * \text{Abs}(XX) + V(9) * \text{Abs}(YY) ^ (V(11))$$

SIN

$$PtX(i) = V(0) + V(1) * XX + V(2) * YY + V(3) * \sin(V(4) * XX) + V(5) * \sin(V(6) * YY)$$

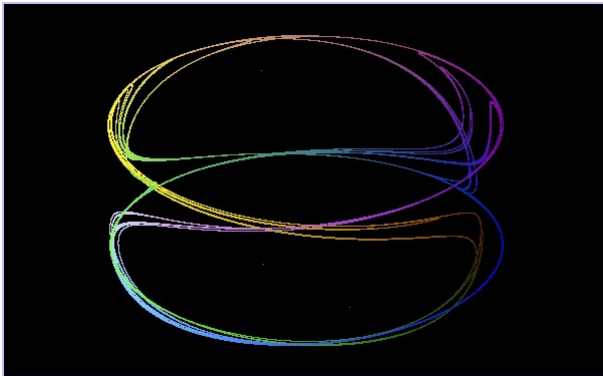

$$PtY(i) = V(7) + V(8) * XX + V(9) * YY + V(10) * \sin(V(11) * XX) + V(12) * \sin(V(13) * YY)$$

GENERATE

Once we choose the Attractor formula we can start generate a new random "curve" with new random $V()$ values and (if checkbox RND start POS is checked) new start position value.

We must wait since some values brings points coordinates to infinite values, then a preview of curve is rendered.

Now, if we like this "curve" we can continue with "Cool Render", otherwise we can click again "Generate" to generate a new random "curve".

TRY to CENTER

Sometimes we can notice that most pixels are placed by a side/corner of the Image.

Clicking here the curve should self center.

COOL RENDER

Here start the image creation process. The time it takes is variable.

The output Image is saved in "OUT" folder.

If you change idea and don't want to wait till the end of renderization process click "Abort Render".

Contrast

Since Ver **4.1** Custom contrast has been implemented.

Here you can see some Examples of the same curve rendered with different "contrast" values:

Contrast **12**

Contrast **25**

Contrast **50**

Contrast **75**

Contrast **100**

Suggested/default value = 50.

BASIC OPTIONS

Basic Options

Click “Basic Options” to change the Number of Points and/or Image Size.

When “Number of point is Changed” and “Apply” is clicked we cannot “Cool Render” again the “curve”.

If we want to render this curve in different size we can change “picture size” with sidebar , click “Apply” and then click “Cool Render”.

LOAD / SAVE

LOAD

SAVE

SAVE:

To click only after “COOL Render”.

If we like a result we can save it by clicking here. Then, with Load button we can load it at any time and “cool render” it again.

This is useful to save our favorites curves and to re-render them at different sizes.

E.G:

- “SAVE” and save your nice curve.
- Exit Application.
- Run Application.
- “Basic Options” to change the output Size
- “LOAD” to load curve.
- “Cool Render”

The same curve can be rendered with different sizes. Its look changes by changing image size.

LOAD:

Click here to load a curve.

Change image size with “Basic Options” (This can be done either Before or After “LOAD”)

Then click “Cool Render” to Render it.

INFINITE LOOP

This simulates an infinite “GENERATE” and “COOL RENDER” buttons click.

Yes, not all generated and rendered pictures will be nice, but you can discard them from the OUT folder.

Click “Stop Loop” to terminate this loop.

PLAY IT

Click “play it” to play the set of generated points as “music”.

X and Y determinate Note and Notes Durations.

Click “STOP” to stop the sound. Suggested when Application is performing other tasks.

ANIMATION

This should perform the animation from a curve to a slightly different curve.

How to do:

-“Generate” a curve

-Click “1” to set this as the 1st curve

-Click “V” to change the $V(0), V(1) \dots V(N)$ values. A new slightly different curve will appear.

-Can click “V” more than once, but sometimes it causes “overflow” or a bad curve.

-Click “2” to set this slightly different curve as the 2nd curve.

-Make Animation . Click here to render frames between 1st and 2nd curve. (it's prompted for how many frames)

Animation Frames are saved in ANIM folder.

[it could take long time]

[NOT TESTED IN 3D MODE]

3D

To activate the 3D mode click “basic options” and then select “3D”.

In 3D mode the “Attractor formulas” to choose from are different.

It's like 2D but a new “Z” axis

3D Animation

3D ANIMATION

Click [here](#) to make a 3D animation.

It's prompted for the number of steps to complete a full 360° Rotation animation. EG: $n=16$ steps correspond to $360/16 = 22.5^\circ$ per frame.

The animation is 4 times a full 360° rotation.

Then it's prompted for the type of rendering.

For Preview the 3D Animation at ["Cool Render" mode] you have to answer "No"

If you answer "yes" every frame will be rendered as "Cool-Render" quality.

Frames are saved in "ANIM" folder.

When process is complete you can make a Video with some software like VirtualDub.
